75 YEARS OF WIND EROSION CONTROL

The History of Wind Erosion Prediction

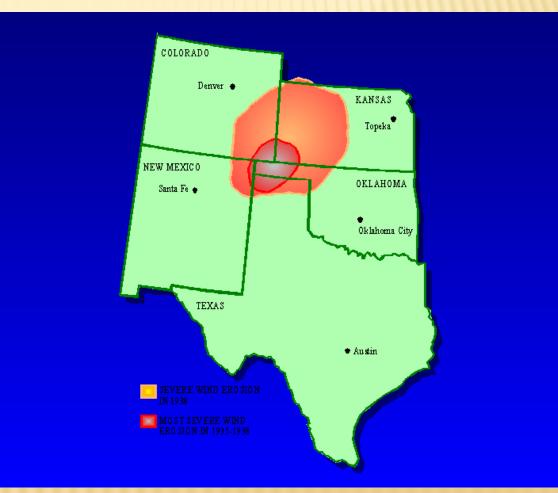

Mike Sporcic, National Wind Erosion Specialist Central National Technology Support Center Fort Worth, TX

Edward L Skidmore, Soil Scientist (retired) USDA - Agricultural Research Service Wind Erosion Research Unit Manhattan, KS

USDA is an Equal Opportunity Employer & Provider

TROUBLE IN THE HEARTLAND

We saw the wind erosion problem when we plowed out the short grass prairie without regard to the soil or the climate

ROOTED IN THE DIRTY THIRTIES

- April 14, 1935 was a dirty day, the "Big Duster"
- Farming in the dry parts of TX, OK, NM, & KS set the nation up for an opportunity to raise concern for wind erosion

Natural Resources Conservation Service

THE DEPRESSION ALSO HELPED

 The National Industrial Recovery Act of 6/16/33 permitted erosion control work.

HUGH HAMMOND BENNETT

- Bennett worked
 as a Soil Scientist
 for the Bureau of
 Chemistry & Soils.
- He used the April 14, 1933, Sunday erosion event to persuade Congress to act.

Natural Resources Conservation Service

WIND EROSION MOVED THE BILL THROUGH

 The dust arrived in time to help Bennett get PL46 passed.

> Natural Resources Conservation Service

R. A. BAGNOLD STARTED IT ALL

- Published in 1941, Bagnold stated, "the subject of sand movement lies far more in the realm of physics than of geomorphology."
- He could be nicknamed the "father of saltation"

The Physics of Blown Sand and Desert Dunes

R. A. BAGNOLD

SCS ESTABLISHES A WIND EROSION PROJECT

- The Research and Marketing Act of 1946 provided funding for the Wind Erosion Project
- Administered by the Research Division of the Soil Conservation Service
- Established on the campus of Kansas State
 Agricultural College at Manhattan, KS in 1947

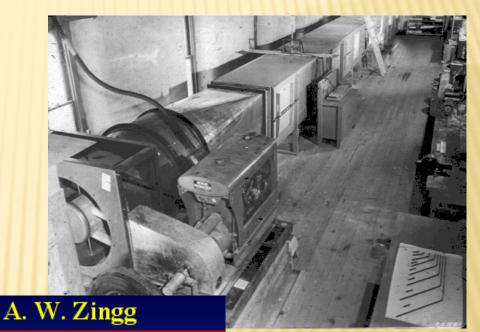

WORK CONTINUED IN THE 40S AND EARLY 50S

W. S. Chepil, A. W. Znigg, and N. P. Woodruff continued to work with wind tunnels and all aspects of wind erosion.

 Znigg headed the early effort.

> Natural Resources Conservation Service

CHEPIL'S WORK ON THE WIND EROSION EQUATION

- From 1953 to 1963 Chepil headed a team that developed the Wind Erosion Equation (WEQ)
- They established the five key factors dealing with wind erosion:
 - + Soil Cloddiness,
 - + Ridge Roughness,
 - + Field Length,
 - + Climate, and

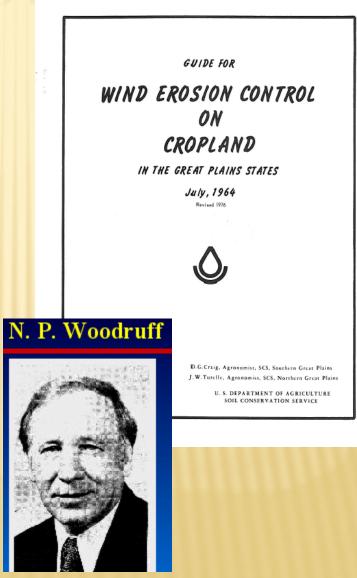

Natural Resources Conservation Service

+ Vegetative Material

N. P. WOORUFF FINISHED WEQ, 1963-1975

- Chepil died in 1963 before his work was published.
- Wooruff and Siddoway published WEQ in 1965.
- The Soil Conservation Service (SCS) began using the model in July of 1964.
- D.C. Craig and J. W. Turelle were the SCS agronomists that published the guide.

WIND EROSION EQUATION WEQ

1965

- E = f (I, K, C, L, V) ► E=soil loss, mass/area/yr
 - ▷ I = soil erodibility
 - K = soil ridge roughness
 - C = climatic factor
 - L = field length

onservation Service

V = vegetative factor

WEQ - IMPROVEMENTS AND MODIFICATIONS CONT

- Wind erosion calculator, Skidmore, 1983
- Wind erosion climatic erosivity, Skidmore, 1986
- Wind erosion direction factors..., Skidmore, 1987
- Modified EPIC wind erosion model, *Skidmore and Williams, 1991*
- Small-grain equivalent of mixed vegetation..., Skidmore and Nelson, 1992

WEQ – IMPROVEMENTS AND MODIFICATIONS, ARS

- *** Assessing Wind Erosion Forces: Directions and...** Skidmore, 1965, (monthly magnitudes of the total wind)
- Wind Erosion Equation: Computer Solution and ... Skidmore, Fisher, and Woodruff, 1970 (Step wise solution for WEQ factors)
- **WEROS: A Fortran IV Program to Solve the Wind...** Fisher and Skidmore 1970 (how to use the computer version)
- **×** Range Grasses and There Small-Grain Equiv...

Lyles and Allison, 1980

And many more though 1992

WEQ QUANTIFIED SOIL LOSS

- × For the first time after 1965, SCS was able to estimate the loss of soil due to wind
- × And develop alternatives to reduce the loss

✤My first one took me 3.5 hours to complete And I was never quite sure I made all the interpolations correctly.

atural Resources Conservation Service

STRUGGLES FOR IMPROVEMENT TO WEQ

× About 1988, computers made their appearance × SCS had a DOS version, a FOCS version, a CAMPS version, and finally in 1998 a MS Excel version that actually made it to the field offices

Maybe they shouldn't have given me the that laptop with prelude!

DESPITE THE MANY IMPROVEMENTS IN WEQ PROBLEMS PERSISTED WITH THE EMPIRICAL MODEL

Climatic factor

Was unrealistically high in arid climates, too low in humid climates, and did not account for irrigation.

Soil erodibility index

did not account for temporal variation of aggregate status as influenced by management, weather, etc.

Erosion by periods

did not account for temporal variation in other model factors like climate, roughness, growing crop, and crop residue.

Vegetative cover

Small grain equivalent was difficult to communicate to the person in the field.

Spatial variability

was not recognized

A BETTER WAY

To better model wind erosion, an effort has been in progress for many years by the USDA – Agricultural Research Service (ARS), to better understand the processes involved and develop a process-based Wind Erosion Prediction System (WEPS).

THE BIRTH OF THE WIND EROSION PREDICTION SYSTEM (WEPS)

- An Organizational meeting was held in October 1985 to develop a replacement model for WEQ.
- × There were major issues with WEQ
- 1. Dryer areas than Garden City, KS seemed to have too high an erosion rate and wetter areas east of the Mississippi River has too low a loss rate.
- 2. Average monthly wind speeds do not predict average soil loss.
- 3. There was a need for more information about wind erosion than just rotational average tons/acre/year.
- **×** WEPS was the answer.

DURING THE 1985 PLANNING MEETING CHANGES WERE SUGGESTED

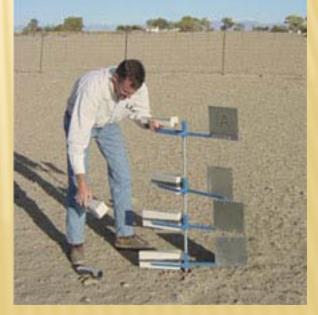

- Dick Amerman, ARS NPL "Develop a physically based model to replace WEQ..."
- Klaus Flack, SCS Chief Scientist was quoted, "We need an erosion prediction, conservation planning tool to document and justify conservation programs, allocate resources... Put some good science into the effort."
- Rex Johnston, ARS Area Director said "Some of our basic concepts are faulty ...lets put some good science into the effort."

ADDITIONAL INFORMATION

- Dr. Bill Fryrear, ARS Big Springs, TX made substantial contributions to the work
- Over 3000 samples from 7 states were rotary sieved to established an erodible fraction for each of the soils
- 8 sites were sample during wind events to calibrate the Wind Erosion Prediction System sub-model.

BSNE Wind Erosion Samplers

THE WERE UNIT AND NRCS

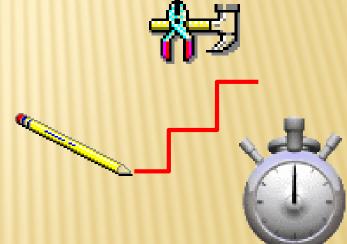

- x Dr. Ed Skidmore and now Dr. Larry Wagner have headed up the ARS Wind Erosion Research Unit at Manhattan, KS established in 1947.
- The project was under the leadership of SCS until 1953 and then went to ARS.
- They have solved many problems with the Wind Erosion Prediction System (WEPS) since 2005 and given NRCS a very good interface to run the seven sub-models in the software.

WEPS ARRIVED

Wind Erosion Prediction System

Process-based Daily time-step Wind erosion model

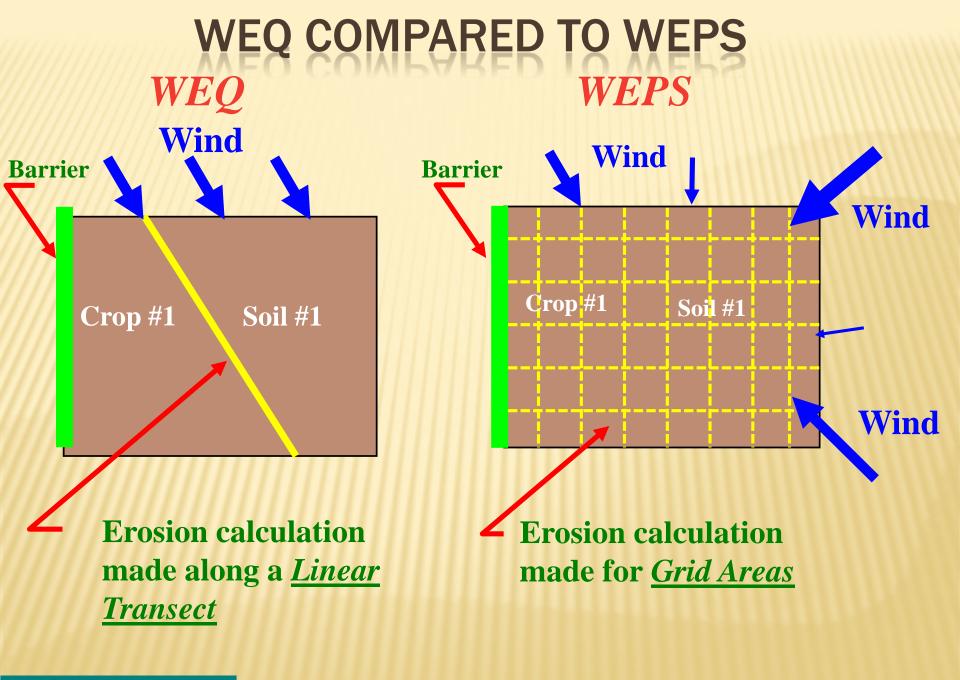

THE WIND EROSION PREDICTION SYSTEM

 WEPS wind erosion model was handed off to NRCS in 2005.

ORCS Natural Resources Conservation Service

WEPS GIVES MORE INFORMATION

WEPS

WEO

Limited

Annual soil loss Period soil loss Saltation/Creep Suspension PM-10 Surface conditions Wind energy **Boundary loss**

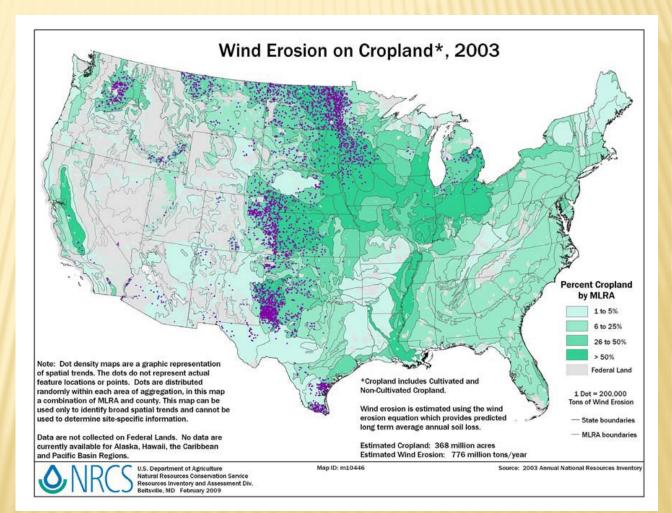

PROBLEMS IN WEQ WERE OVERCOME BY WEPS

- Climate Factor (error in WEQ)
 - was unrealistically high in arid regions
 - was too low in humid climates
 - did not account for irrigation and rainfall on surface conditions
- Soil Erodibility (error in WEQ) did not account for temporal variation of aggregate status.
- Erosion by Periods (in WEQ) did not account for temporal variations factors such as climate, roughness, growing crops, and crop residue.
- Vegetative Cover (in WEQ) Small grain equivalent was difficult to concept to explain and teach.
- Roughness (random and oriented) is now temporally degraded and accounted for
- × Spatial Variability is now considered

THE NEED IS STILL THERE

Each dot •
 represents
 200,000 t/yr

 The National Resource Inventory shows 776 million t/yr loss to wind erosion

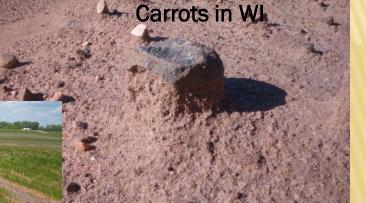

ANRCS Natural Resources Conservation Service

This map is based on WEQ and does not show correct losses for the eastern US.

THERE IS STILL MUCH WORK TO BE DONE

Cotton in TX

Surgarbeets planted into WW cover in MN

Sugarcane in HI

WW after Potatoes in ID

NEW WORK-MUCK

× Ted Zobeck, ARS Lubbock,TX and John Tatarko, ARS Manhattan, KS are working on a 3 to 5 year project to better understand wind erosion on Muck soils.

TRENDS THAT ARGUE THE NEED FOR FUTURE APPLICATIONS OF WEPS:

- × Widespread use of cellulose for ethanol
- Increased planting of low residue crops
- Expanding urban areas
- × Depletion of aquifers i.e. Ogallala
- × Climate change
- Work on wind erosion and dust emissions from rangeland. (Southern NM, Tucson, Phoenix, and Southern CA)
- Temporal changes of soil textures and wind removal of residue and snow.

SUMMARY

- Wind erosion prediction was born out of the dirty 1930s "dust bowl days"
- The Soil Conservation Service worked very hard to get growers to use the best conservation practices.
- Many good scientists have contributed to a much better way to predict wind erosion.
- With the new Wind Erosion Prediction System the Natural Resources Conservation Service can further the work to address the wind erosion that remains.

USDA is an Equal Opportunity Employer & Provider
